Project Title	Object Tracking in Unmanned Aerial Vehicle
Technologies	Deep Computer Vision
Domain	Robotics
Project Difficulties level	Intermediate

Problem Statement:

The use of unmanned aerial vehicles (UAVs) for surveillance, such as real-time anomaly detection, is generating a lot of buzz. Unmanned Aerial Vehicles (UAVs) are already being used in a variety of military and civilian roles because to recent developments in avionics and electronics systems. One of the most appealing features of UAVs is their capacity to reach isolated areas that are unreachable to human operators, allowing for a unique aerial perspective in visual surveillance. Anomalies must be detected in real time by autonomous visual surveillance systems. However, there are numerous challenges connected with automatically detecting abnormalities by a UAV, as seen by the paucity of suggested contributions addressing abnormal event identification in drone video recordings. We offer an anomaly detection approach in a surveillance mission where videos are recorded by an unmanned aerial vehicle (UAV) in this research.

The main objective here is -

1. Sense and Avoid system integrated into UAV to detect and track other aerial objects with electro-optical sensors.

2. Send GPS Coordinate of the particular aircraft and also raised an alarm

3. Maintain a database to store each and every data generated by UAV or received on request to the database or in the storing space available on edge devices.

Dataset:

You have to collect your dataset for this project from different sources and based on that, you have to design your solution and create a repo for the dataset.

Project Evaluation metrics:

Code:

- You are supposed to write a code in a modular fashion
- Safe: It can be used without causing harm.
- Testable: It can be tested at the code level.
- Maintainable: It can be maintained, even as your codebase grows.
- Portable: It works the same in every environment (operating system)
- You have to maintain your code on GitHub.
- You have to keep your GitHub repo public so that anyone can check your code.
- Proper readme file you have to maintain for any project development.
- You should include basic workflow and execution of the entire project in the readme file on GitHub
- Follow the coding standards: https://www.python.org/dev/peps/pep-0008/

Database:

- You are supposed to use a given dataset for this project which is a Cassandra database.
- https://astra.dev/ineuron

Cloud:

- You can use any cloud platform for this entire solution hosting like AWS, Azure or GCP

API Details or User Interface:

- You have to expose your complete solution as an API or try to create a user interface for your model testing. Anything will be fine for us.

Logging:

- Logging is a must for every action performed by your code use the python logging library for this.

Click here to enter text.

Ops Pipeline:

- If possible, you can try to use AI ops pipeline for project delivery Ex. DVC, MLflow , Sagemaker , Azure machine learning studio, Jenkins, Circle CI, Azure DevOps , TFX, Travis CI

Deployment:

- You can host your model in the cloud platform, edge devices, or maybe local, but with a proper justification of your system design.

Solutions Design:

- You have to submit complete solution design strategies in HLD and LLD document

System Architecture:

- You have to submit a system architecture design in your wireframe document and architecture document.

Latency for model response:

- You have to measure the response time of your model for a particular input of a dataset.

Optimization of solutions:

- Try to optimize your solution on code level, architecture level and mention all of these things in your final submission.
- Mention your test cases for your project.

Submission requirements:

High-level Document:

You have to create a high-level document design for your project. You can reference the HLD form below the link.

Sample link:

HLD Document Link

Click here to enter text.

Low-level document:

You have to create a Low-level document design for your project; you can refer to the LLD from the below link.

Sample link

LLD Document Link

Architecture: You have to create an Architecture document design for your project; you can refer to the Architecture from the below link.

Sample link

Architecture sample link

Wireframe: You have to create a Wireframe document design for your project; refer to the Wireframe from the below link.

Demo link

Wireframe Document Link

Project code:

You have to submit your code GitHub repo in your dashboard when the final submission of your project.

Demo link

Project code sample link :

Detail project report:

You have to create a detailed project report and submit that document as per the given sample.

Demo link

DPR sample link

Click here to enter text.

Project demo video:

You have to record a project demo video for at least 5 Minutes and submit that link as per the given demo.

Demo link

Project sample link :

The project LinkedIn a post:

You have to post your project detail on LinkedIn and submit that post link in your dashboard in your respective field.

Demo link

Linkedin post sample link :
